

Manila Rope

Last Updated Wednesday, 08 October 2008

Manila is manufactured from a hard natural fiber. Manila's long fibers give it greater strength and easier handling than sisal. Manila has a high abrasion resistance with low stretch and is especially resistant to sunlight. The strength and durability of manila help it to withstand mildew and deterioration. Manila also has good knot holding ability. This general-purpose rope meets the demands of industrial, agricultural and shipping jobs.

Tytan stocks manila throughout the United States in many diameters starting at 3/16" and up. We also stock 4-strand manila (Catline) and mini coils.

Typical applications include: General industrial uses, marine, scaffold, drilling, tie-down, agricultural, landscaping.
